(650) 452-5427

To Whom It May Concern:

Bryan Tong was hired as software intern for Nokia Bell Labs, during the summer of 2017. He was working in the Innovation Incubation team in Sunnyvale, reporting to me.

The primary reason we hired Bryan, was his technical experience in Augmented Reality (AR), Virtual Reality (VR) and 3D gaming programming as one of the leaders in UC Berkeley's AR/VR Club. During his internship, he successfully implemented two AR prototypes (AR Overlay for object recognition, AR overlay for OneApp icosphere) and started work on the third (AR Overlay for indoor navigation and radio ray tracing). His presentation and demo were well received.

What came as a happy surprise was Bryan's additional contribution to web client and iOS mobile app development. For the former he teamed up with another intern, providing his expertise in UI/UX design. For the latter, he quickly picked up some bug fixing and feature development tasks for a highly complex mobile application. Not a small feat for 12 weeks.

Maybe even more important than his technical competence, he demonstrated a few personal traits that bode well for a successful career: curious, proactive and take initiatives, learn fast and dive deep, work both independently and collaboratively.

I would highly recommend Bryan to any potential employer and support his continued quest for more learning and exploration.

Yours truly,

Zheng Li
